General Description

The HT23C128 is a read-only memory with high performance CMOS storage device whose 128K of memory is arranged into 16384 words by 8 bits.

For application flexibility, the chip enable and output enable control pins can be selected as active high or active low. This flexibility not only allows easy interface with most microprocessors, but also eliminates bus contention in multiple bus microprocessor systems. An additional feature of the HT23C128 is its ability to enter the standby mode whenever the chip enable (CE/ \overline{CE}) is inactive, thus reducing current consumption to below 30 μ A. The combination of these functions makes the chip suitable for high density low power memory applications.

Functional Description

The HT23C128 has two modes, namely data read mode and standby mode, controlled by $CE/\overline{CE}/OE2/\overline{OE2}$, $OE/\overline{OE}/NC$ and $OE1/\overline{OE1}/NC$ inputs.

- Standby mode

The HT23C128 has lower current consumption, controlled by the chip enable input (CE/\overline{CE}). When a low/high level is applied to the CE/\overline{CE} input regardless of the output enable ($OE/\overline{OE}/NC$ and $OE1/\overline{OE1}/NC$) states, the chip will enter the standby mode.

- Data read mode

When both the chip enable ($CE/\overline{CE}/OE2/\overline{OE2}$) and the output enable ($OE/\overline{OE}/NC$ and $OE1/\overline{OE1}/NC$) are active, the chip is in data read mode. Otherwise, active CE/\overline{CE} and inactive $OE/\overline{OE}/NC$ or $OE1/\overline{OE1}/NC$ result in deselect mode. The output will remain in Hi-Z state.

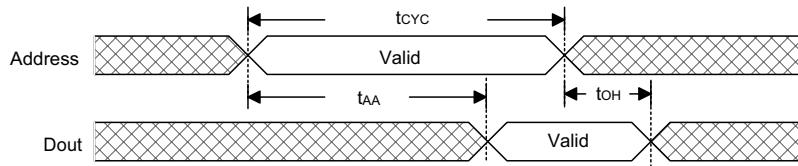

Operation Truth Table

Mode	CE/\overline{CE}	OE/\overline{OE}	$OE1/\overline{OE1}$	$A0\sim A13$	$D0\sim D7$
Read	H/L	H/L	H/L	Valid	Data Out
Deselect	H/L	L/H	X	X	High Z
Deselect	H/L	X	L/H	X	High Z
Standby	L/H	X	X	X	High Z

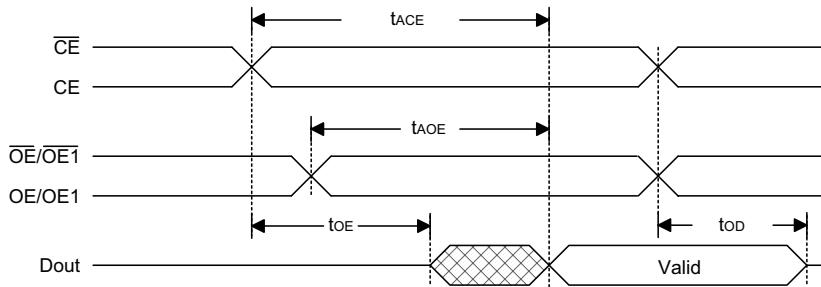

Note: H= V_{IH} , L= V_{IL} , X= V_{IH} or V_{IL}

Timing Diagrams

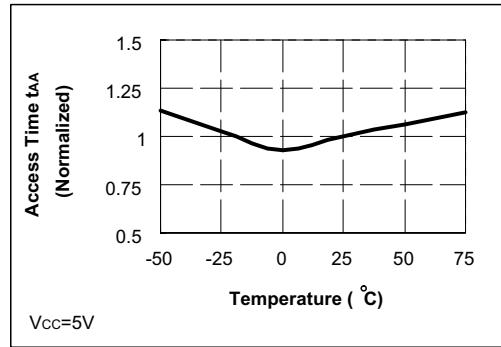

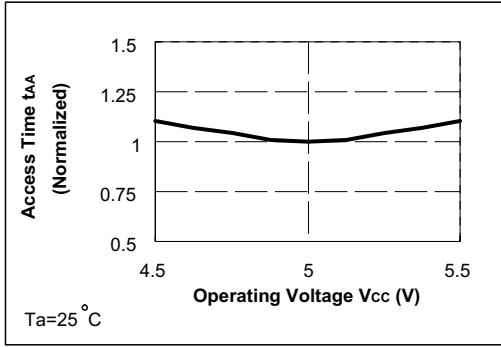

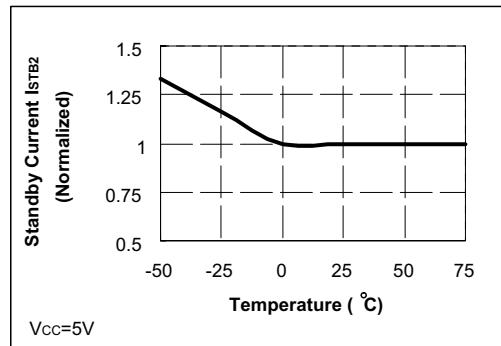

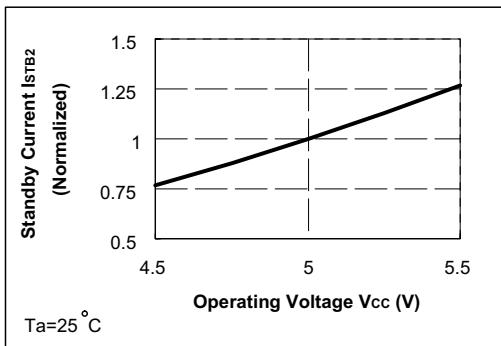

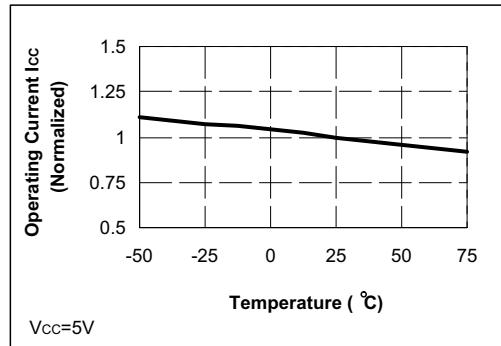

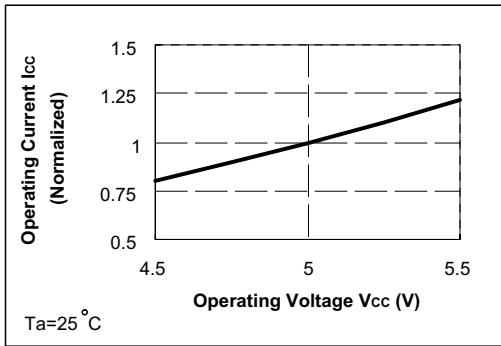

- Propagation delay due to address ($CE/\overline{CE}/OE2/\overline{OE2}$, OE/\overline{OE} and $OE1/\overline{OE1}$ are active)

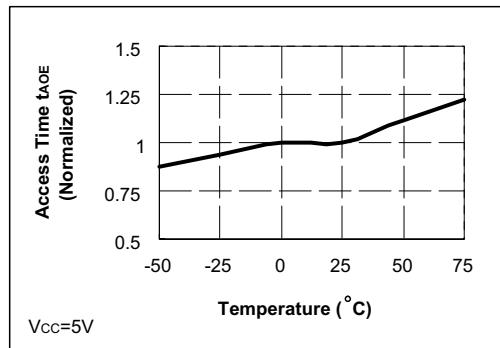

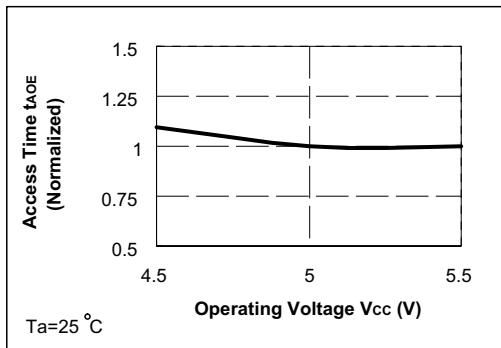

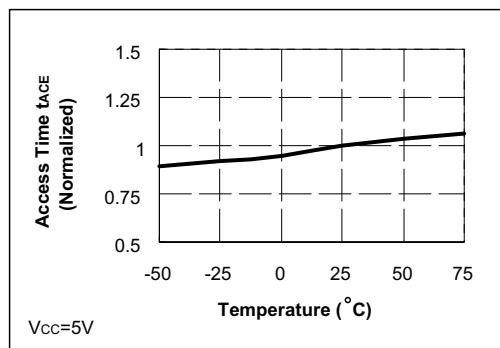

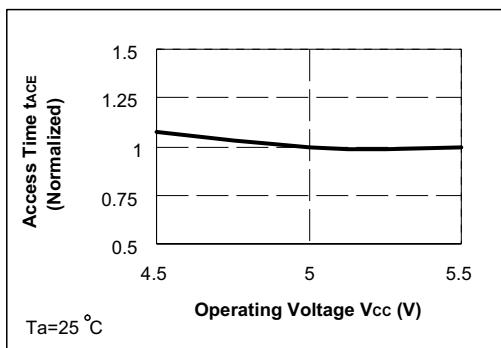

- Propagation delay due to chip enable and output enable (address valid)
